Background

European explorer's, beginning with Cabot's 1497 attempt to sail to the Orient from England, searched for the *Northwest Passage*, a route through the Arctic Ocean along the coast of Canada. See Figure 1. The Norwegian explorer Amundsen was the first to complete the journey, though it took from 1903 to 1906. In 1957, the U.S. Coast Guard Cutter *Storis* became the first U.S. vessel to circumnavigate the continent, a 22,000 mile trek.

The problem is the Arctic Ocean is covered by a sea ice pack nearly all the time—the passage is closed. Since the beginning of the Industrial Revolution, global temperature averages have risen overall causing more of the ice pack to melt in the summer, which leaves more ocean open. Ice is very reflective giving the arctic region a high *albedo*; ice reflects up to 70% of the sun's energy. The ocean is darker, reflecting only 6% of the sun's energy, so as the ice pack retreats, the area's albedo gets lower. More energy is absorbed by ocean water than by sea ice increasing the temperature, causing more ice to melt leading to more open water, creating a positive feedback loop.

NASA's *National Snow and Ice Data Center* at the U. of Colorado, Boulder, has collected data provided by satellites, over-flights, submarines, and other observations measuring the amount of sea ice in the Arctic Ocean for several decades. Figure 2 shows the average July total arctic sea ice area in millions of square kilometers versus the year from 1979 to 2011. The line ("line of best fit") in Figure 2 shows an annual decrease of 6.8% in the amount of sea ice cover for the Arctic Ocean. If positive feedback causes the rate of change to be increasing, a linear trend will underestimate sea ice loss.

Project

Determine the overall trend in the average monthly sea ice extent using the data given in Table 1.

1. List the month _____ your group is assigned.
2. Use NSIDC's *Arctic Sea Ice Extent Averages* data given in Table 1 for your assigned month to derive a linear function giving the overall trend of the average sea ice extent.
3. Plot the linear function and your data on the same graph.
4. Predict your month's 2013 and 2014 values.
5. Explain why the slope of the linear function describes the trend of your data. What is the trend as a percentage?
6. Is the trend you found reasonable? Why or why not?

Extra for Experts: Explore quadratic models of the data.

Report Requirements

Your report must include:

1. Your project team members' names.
2. Your linear model and predictions for 2013 and '14 with a justification of its appropriateness.
3. A graph showing your model with the data points.
4. A discussion of the trend you calculated and whether or not it reasonably describes the data.

Possible formats for your final report:

- a standard paper (in **pdf** format; **not** doc, docx, &c.)
- a slide-show (Impress, Keynote, Powerpoint, or pdf)
- a video of your team presenting to a group of classmates (in Quicktime or Windows Media format; mp4, mpeg, mov, wmv, or avi; **not** flv or swf)
